Vijay Krishna's 2e of Auction Theory improves upon his 2002 bestseller with a new chapter on package and position auctions as well as end-of-chapter questions and chapter notes. Complete proofs and new material about collusion complement Krishna's ability to reveal the basic facts of each theory in a style that is clear, concise, and easy to follow. With the addition of a solutions manual and other teaching aids, the 2e continues to serve as the doorway to relevant theory for most students doing empirical work on auctions. Focuses on key auction types and serves as the doorway to relevant theory for those doing empirical work on auctions. New chapter on combinatorial auctions and new analyses of theory-informed applications. New chapter-ending exercises and problems of varying difficulties support and reinforce key points.

"Krishna's superb Auction Theory is an ideal text and reference because his clear and precise exposition distills the vast literature and provides excellent motivation, examples, exercises, and connections to commercial applications." -- Robert B. Wilson, Stanford University "On its publication in 2002, Vijay Krishna's book immediately became a central reference in auction theory. But the subject has continued to develop, and so we're very fortunate that Krishna has now updated the text." -- Eric Maskin, Institute for Advanced Study, Nobel Laureate in Economics
